May 2026 — Open Proposal Status

This is a voluntary open proposal initiated by Brianna Baynard. It is not an official standard, accredited certification body, or regulatory requirement. The proposed requirements below are provided for early testing, feedback, and real-world implementation. Formal validation or certification processes are currently paused.

1. Executive Overview

NHID-Clinical proposes a minimum control baseline for AI voice agents in business-to-business healthcare administrative workflows. It establishes five core behavioral and operational requirements focused on timely disclosure, non-deceptive behavior, escalation, and auditability.

2. Problem Statement: Solving Impersonation Latency

AI voice agents frequently disclose their non-human identity too late or only when challenged. This creates “impersonation latency” — wasted time and risk when human staff cannot immediately determine they are speaking with automation.

Scope

- Applies exclusively to payer–provider administrative voice workflows (claims status, eligibility verification, prior authorization, etc.)

- Focuses on protected operational data (NPI, member ID, claim number, etc.)
- Out of scope: patient-facing systems and general identity & access management

3. Proposed Requirements

3.1 Identity Disclosure Gate (IDG-01)

The AI agent should disclose its non-human identity before any operational data is solicited or received.

3.2 Pre-Data Exchange Disclosure (PDX-01)

Disclosure must occur before requesting or receiving protected operational data.

3.3 Deceptive Behavioral Constraints (DBC-01)

The agent should not use audio artifacts designed to simulate human presence (simulated breathing, typing sounds, filler words, etc.).

3.4 Escalation Path (EIT-01)

The agent should provide a clear escalation path to a human representative when requested or when automation cannot proceed.

3.5 Audit Trail Requirements (ATR-01)

Maintain structured logs including disclosure timestamp, first data request timestamp, call outcome, and escalation reference ID.

4. Implementation Guidance

1. Audit current disclosure timing
2. Remove prohibited human-mimicry artifacts from TTS engines
3. Implement reliable escalation to human staff

4. Add proper audit logging
5. Self-test against the five requirements
6. Share feedback with the community

5. Relationship to NHID-Auth v1.0

NHID-Clinical focuses on behavioral disclosure. NHID-Auth addresses delegated authority verification. The two proposals are complementary and can be adopted independently or together.
