

NHID-Clinical v1.3

Core Specification

Non-Human Identity Disclosure Standard for Healthcare Voice Workflows

Abstract

NHID-Clinical defines a minimum control baseline for AI voice agents in business-to-business healthcare administrative workflows. The standard establishes three core behavioral requirements: disclosure before data exchange, prohibition of deceptive human-mimicry artifacts, and clean escalation to human representatives when automation fails. Built from operational experience enforcing HIPAA compliance in payer-side dental administration, this specification addresses 'impersonation latency'—the operational time wasted when human staff cannot immediately determine if a caller is automated.

1. Problem Statement

AI voice agents are calling healthcare payers and providers to request claim status, eligibility information, prior authorization updates, and other protected operational data. These systems frequently disclose their non-human identity only after being challenged, or only after sensitive workflow data has already been shared with an entity whose authorization status cannot be verified.

This creates three operational gaps:

Disclosure Gap: AI systems identify themselves too late or only when challenged

Deception Gap: Voice agents use artifacts (breathing, typing, filler) designed to fake humanity

Authorization Gap: Public identifiers (NPI) treated as proof of delegated authority

2. Scope

NHID-Clinical v1.3 Core applies exclusively to AI voice agents calling in business-to-business healthcare administrative workflows—specifically payer-to-provider and provider-to-payer voice interactions where protected health information (PHI) or operational workflow data may be disclosed.

In Scope:

- Claims status inquiries
- Eligibility verification calls
- Prior authorization follow-up
- Benefits verification
- Provider credentialing status checks
- Payment reconciliation calls

Out of Scope:

- Patient-facing clinical advice systems
- General identity and access management frameworks
- All AI applications in healthcare (this is workflow-specific)
- Technical transport protocols (SIP, WebRTC)—covered in future NHID-Protocol specification

3. Normative Requirements

The following requirements use RFC 2119 terminology. Implementations MUST satisfy all requirements to claim NHID-Clinical v1.3 conformance.

3.1 Pre-Data Exchange Disclosure (PDX-01)

Requirement: An AI voice agent MUST disclose its non-human identity before requesting or receiving any protected operational data, including but not limited to: National Provider Identifier (NPI), member ID, date of service, claim number, or any patient-identifiable information.

Test Method: Log analysis comparing timestamp of first disclosure statement against timestamp of first data request or data disclosure.

Pass Criteria: Disclosure timestamp precedes all data exchange timestamps by at least 1 second in 100% of sampled interactions.

3.2 Deceptive Behavioral Constraints (DBC-01)

Requirement: An AI voice agent MUST NOT include audio artifacts explicitly designed to simulate human presence. Prohibited artifacts include but are not limited to:

- Simulated breathing sounds
- Keyboard typing sounds during pauses
- Artificial 'um,' 'uh,' or filler words inserted for humanization
- Mouse clicking sounds
- Background office noise designed to suggest human environment

Test Method: Audio analysis of recorded calls for presence of listed artifact categories.

Pass Criteria: Zero instances of prohibited artifacts detected in sampled interactions.

3.3 Escalation Path (EIT-01)

Requirement: An AI voice agent MUST provide a documented escalation path to a human representative when:

- The receiving party requests human contact
- The automated system cannot complete the workflow
- Authorization verification is challenged

Test Method: Request human escalation during test call and measure response.

Pass Criteria: System provides reference ID and callback number OR transfers to live representative within 60 seconds.

4. Certification Framework

NHID-Clinical certification operates on three tiers. Certification is voluntary and additive—L2 requires L1, L3 requires L2.

Level	Requirements	Evidence	Cost
L1 Baseline	Pass all 3 core tests (PDX-01, DSC-01, EST-01)	Self-audit + transaction logs showing disclosure timestamps	Free
L2 Operational	L1 + 30 days production logs + security incident response documentation package	Supplier audit + control	\$500
L3 Enterprise	L2 + third-party audit + registry verification + technical integration tests	Forced audits + technical integration tests	\$1000

5. Implementation Pathway

Organizations adopting NHID-Clinical should follow this sequence:

Step 1: Audit Current Disclosure Timing

Review existing call recordings or transaction logs to identify where disclosure occurs relative to data requests. Measure the time gap between call initiation and first disclosure statement.

Step 2: Remove Prohibited Artifacts

Review audio output for breathing sounds, typing sounds, filler words, or other humanization artifacts. Remove these elements from voice synthesis pipelines.

Step 3: Implement Escalation Path

Ensure the system can provide a reference ID and callback number when human contact is requested, or transfer directly to a live representative within 60 seconds.

Step 4: Run Conformance Tests

Execute the three core test cases (PDX-01, DBC-01, EIT-01) against production logs to verify compliance.

Step 5: Submit for Certification

Organizations ready for L1 certification can self-attest via nhid-clinical.org/validation. Higher certification tiers require audit-ready documentation and third-party review.

Detailed test procedures, evidence templates, and failure condition examples are available in the NHID-Clinical Conformance Guide (separate document).
